The use of outcome data monitoring in the quality assurance of MI services

Matthew Jones & Pym Pettitt, Pharmacy Department, Royal United Hospital, Bath

Introduction

- In recent years, the effects of Medicines Information (MI) services on patient outcome have become a focus for research.
- Positive effects of an MI enquiry answering service for healthcare professionals (HCPs) have been demonstrated (1) & small scale projects have found similar benefits for patient helplines (2).
- If patient outcome data could be collected continuously through routine MI quality assurance programmes, they might provide a powerful tool for monitoring the quality & value of an individual MI service.

Discussion

- Questions regarding patient outcome can be included in regular MI user surveys whilst still achieving good response rates.
- The data obtained can be used to ensure the MI centre in question is working to a high standard & to demonstrate the patient value obtained from the provision of the service.
- HCP enquiry outcome questions are already validated & could be quickly incorporated into the national MI user survey.
- Further work is required to validate patient helpline outcome questions. This should be a high priority for future research.

Healthcare Professional Enquiries

- Two key patient outcome questions (with rating scales) for HCP enquiries were validated in a recent national study (1):
  - How did the advice from MI affect your patient’s care or outcome?
  - How did the advice from MI affect the safety of your patient’s drug therapy?
- These questions were added to the standard national user survey. In other regards, the survey remained unchanged.
- Response rate before & after adding outcome questions: 78% to 68%
- Proportion of respondents who answered outcome questions: 61%
- Responses to outcome questions received over the first 2.5 years: 86

Patient Helpline

- No validated tool to measure patient outcomes
- A simple survey was devised & distributed by post
- 49% response rate
- 29% of callers providing feedback over 18 months

Enquirers’ assessment of the overall impact of MI advice on patient care & safety. These figures are comparable with data from the original national study (1).

Possible patient benefits

Understanding ↑ about...

Sources of advice if no helpline

100% of respondents stated that they found the advice they received helpful & that they followed it
98% of respondents stated that calling the helpline improved their experience of the hospital
19% Proportion of calls during which a medication error was identified & corrected

Discussion
